Speakers:

Brian Aker
Jean-Francois Arcand
Thies Arntzen
Aaron Bannert
David Bau
Stas Bekman
Stephen Betts
Rich Bowen

Marcus Borger
Kin-man Chung
Ken Coar
John Coggeshall

Mark Cox
Wesley D. Craig
Thomas DeWeese
Joe Gregorio
Ceki Gulcu
Hartmut Holzgraefe
Sterling Hughes
Will Iverson
Nick Kew

Presentation:

TU08: MySQL Clustering and Replication for the Web
MO14: Tomcat 5 new features.
T02: PHP inside-out
TU02: Advanced Topics in Module Design: Threadsafety and Portability
MO09: Inside Apache XMLBeans
T08: mod_perl 2.0 By Example
WE16: Localising BBC News for a Global Audience
TU01: Apache authentication, TU05: Apache performance, TU21: URL Mapping,
WE10: Apache handlers with mod_perl , T04: Introduction to the Apache Web Server
WE17: PHP 5 and databases
MO10: Jasper, the JSP compiler in Tomcat 5
PL01: Opening plenary , PL03: Closing/Wrapup Session
WE01: Creating Dynamic PDFs using PHP , WE13: Making the most of PEAR and PECL
WE07: HTML manipulation and data mining with Tidy
TU13: Apache Security Secrets Revealed
TU20: Open Source Web Single Sign On
MO08: Java Applications with Apache Batik
MO20: Extending HTTP Authentication
TU07: What is new in log4j version 1.3?
TU24: WebDAV server implementation with Apache and PHP
T02: PHP inside-out
MO18: Using Tomcat to build Desktop Applications
TU14: Building smart markup-aware applications with Apache modules

Presentation:

WE05: Do you PHP?
MO05: Everything you always wanted to know about XML parsing
MO01: XML at the ASF: The XML, WS, and Cocoon projects
MO04: Beginning Tapestry: Java Web Components
MO19: Apache XML Parser: Xerces2 and Xerces C++
TU22: ASP.NET on Unix with mod_mono, TU09: Securing Apache
PL02: How the Apache Software Foundation works, MO17: Past, present and future of the Apache Cocoon project, MO11: Virtual Community Dynamics
TU23: Building Web Applications with the Struts Framework
TU20: Open Source Web Single Sign On
TU11: Using Xalan to achieve application interoperability.
MO02: Tomcat Performance Tuning and Troubleshooting
MO13: Introducing Apache Cocoon
TU04: Jakarta POI or "Maybe we shouldn't ingore the 10,000 lb Gorilla"
WE12: Mod_pubsub: asynchronous publish and subscribe messaging with httpd
MO16: The Atom API
WE15: RSS Elements and Versions , KN02: The Death of Email Marketing
MO15: Torque and OJB - the Apache persistence frameworks
TU12: Cocoon control flow
WE14: Developing Web Applications with CGI::Application
T06: Programming SVG
TU16: Porting CMS applications to WebDAV and Cocoon
WE04: Parallel Development and Hosting using Apache, Tomcat, and MySQL

Speakers:	Presentation:
Mark Roth	MO06: JavaServer Pages 2.0 Technology: The Community Delivers!
Theo Schlossnagle	T10: Scalable Internet Architectures
Henning Schmiedehausen	TU03: What's new in the Jakarta Turbine 2.3 Web application Framework
	T11: Writing a web application with Jakarta Turbine 2.3
Doc Searls	KN03: Apache and Do-It-Yourself IT (DIY-IT)
Chris Shiflett	WE09: PHP Attacks and Defense
Trent Shue	WE08: ObjectWeb/JOnAS J2EE Application Server and Apache projects
Bruce Snyder	MO07: The State of Apache Geronimo
Greg Stein	WE20: Subversion: Version Control Rethought, TU17: WebDAV and Apache
Sander Striker	T05: Apache 2.0 modules: development and debugging
Sander Temme	TU10: Apache and Zeroconf Networking, MO12: Shoehorning Apache Onto Your Box: System Sizing Tips
Doug Tidwell	TU15: Building a Web service from SOAP to Nuts, T01: Generating beautiful PDF files with FOP, T07: Mangling data with XSLT
Mads Toftum	T03: Apache 2 mod_ssl tutorial, WE11: Apache mod_rewrite, the Swiss Army Knife of URL manipulation, WE03: Troubleshooting Apache configurations
Adam Trachtenberg	MO03: XML in PHP 5
Michael Wechner	TU06: Content Management with Apache Lenya
Casey West	WE18: Advanced Apache Administration with Perl
Jim Winstead	WE19: Writing a PHP Extension
Mark Womack	TU07: What is new in log4j version 1.3?
Cliff Woolley	T05: Apache 2.0 modules: development and debugging
Geoffrey Young	WE06: Why mod_perl 2.0 Sucks, Why mod_perl 2.0 Rocks
Carsten Ziegeler	TU19: The Cocoon Portal: More than the Portlet API (JSR 168)

APACHECON US 2003
Nov 16-19

Power On/Off

Speaker: Brian Aker
Bio: Brian Aker has been involved with different net communities long before the web took the Internet to it's current heights. He is currently works on the MySQL Database Engine and spends the rest of his time working on Apache, MySQL and Perl modules, which include mod_layout and the Apache streaming services module, mod_mp3. He recently coauthored the "Running Weblogs with Slash" book for O'Reilly. In the past, he has been involved with projects ranging from creating datawarehouses for the Army Engineer Corps to The Virtual Hospital, which was one of the first and largest online medical repositories. He spent several years working on the Slash site engine for Slashdot. He currently works for MySQL as a Senior Architect and teaches the perl certification course at the University of Washington. He lives in Seattle, Washington with his dog Rosalynd.

Speaker: Jean-Francois Arcand
Bio: Jean-Francois Arcand is working for Sun Microsystems since 2000. He currently works on jakarta Tomcat as well as SunONE Application Server. Before joining Sun, he has worked as a software architect for compagny such as France Telecom, Microcell Telecom and HMS Software, in both Java and C++.

Speaker: Thies Arntzen
Bio: Thies Arntzen is an independent consultant based in Hamburg, Germany. He is a member of the PHP-Group and has written various PHP modules.

Speaker: Aaron Bannert
Bio: Aaron Bannert is a member of the Apache Software Foundation and is currently an independent consultant. He spends most of his time working on the httpd and APR projects, but has been known to work on the PHP Apache 2 module as well as being co-author of flood. Lately he has been spending time in the embedded Linux world. Aaron has finally escaped from the Orange Curtain of Southern California, and for now takes refuge in the northern regions (San Francisco).

Speaker: David Bau
Bio: David Bau is one of the original developers of XMLBeans, which he started because he could not find a complete XML Schema library in Java that met his needs. He has contributed to a spectrum of efforts ranging from the GPL'ed DQSD project to Microsoft's IE and .NET. He is currently a senior engineer at J2EE leader BEA Systems.

_

Click to return_

Speaker: Stas Bekman
Bio: Stas Bekman is an author of the mod_perl guide, a monthly columnist at perl.com and ApacheWeek. Hehas co-authored the Practical mod_perl book for O'Reilly and Associates, Inc. He can be reached at stas@stason.org.

Speaker: Stephen Betts
Bio: Stephen Betts has worked for BBC News for four years. He has been Technical Lead for many projects, such as the General Election website and the BBC children's news website. Since 2002 he has led the Online Systems Development team for BBC News, which is responsible for the development of all applications deployed on the public-facing webservers.

Speaker: Rich Bowen
Bio: Rich Bowen is a Security Analyst for Sys ems Design Group in Lexington, Kentucky. Rich is the author of "Apache Server Administrator's Handbook". He is a member of the Apache documentation project and of the Apache Software Foundation.

Speaker: Marcus Borger
Bio: Marcus Börger is a freelancer located in Germany and is specialized on C/C++, Databases, UML, XML and of course PHP. To the PHP community he is also known as helly. He is one of the core developers and focused on the new OO features of PHP 5 and Zend Engine 2. Marcus 'hacks' around on all kinds of stuff for over 15 years now and is currently working for Ford Motor Company.

Speaker: Kin-man Chung
Bio: I have been developing compilers and tools for over 15 years. I have been a committer on Jakarta Tomcat project for over 2 years, working primarily on the JSP compiler, Jasper.

Speaker: Ken Coar
Bio: Ken Coar is a director and vice president of the Apache Software Foundation, and a Senior Software Engineer with IBM. He has over two decades of experience with software engineering and system administration. Ken has worked with the Web since 1992, and in addition to working on Apache and PHP he is heading the project to develop Internet RFCs for CGI. He is the author of'Apache Server for Dummies', a lead author of 'Apache Server Unleashed', and has just finished a new book, 'Apache Cookbook'.

_

Click to return_

Speaker: John Coggeshall

Bio: John Coggeshall is a PHP consultant and author who started losing sleep over PHP around five years ago. Lately you'll find him losing sleep meeting deadlines for books or online columns on a wide range of PHP topics. You can find his work online at O'Reilly Networks onlamp.com and Zend Technologies, or at his website http://www.coggeshall.org/. John has also contributed to Apress' Professional PHP4 and is currently in the progress of writing the PHP Developer's Handbook published by Sams Publishing.

Speaker: Mark Cox

Bio: Mark Cox is the lead for the Security Response Team at Red Hat. He has developed a number of free and open-source software products for more than 9 years; being a founding member of both the OpenSSL group and the Mozilla Crypto Group, a core Apache developer since 1995, and the editor of Apache Week. He currently is a member of the Apache Software Foundation board of directors.

Speaker: Wesley D. Craig

Bio: Wesley D. Craig joined the University of Michigan in 1987, where he designed and wrote netatalk, an implementation of the AppleTalk protocol suite for the Unix operating system. He is currently the Senior IT Architect and Engineer for the University of Michigan Computing Environement. He manages RSUG, the team that runs the University's central LDAP directory, e-mail, and charged-for printing systems. Recent projects include radmind, a suite of tools for Unix and Macintosh filesystem management; and cosign, a web-based single sign-on system.

Speaker: Thomas DeWeese

Bio: Thomas DeWeese is a Senior Software Engineer at Eastman Kodak Company, in Rochester New York where he has worked since 1994. Thomas has made contributions to the Java2D and Java Advanced Imaging APIs. He has also participated in the Jini Printing Working group. From 2001 to 2003 Thomas was Kodak's primary SVG Working Group Member. Thomas has also been a major contributor to the Apache Batik project, an OpenSource implementation of SVG in Java, since it's creation in late 2000.

Speaker: Joe Gregorio

Bio: Joe Gregorio, President, BitWorking, Inc, is an active member in the Atom and RSS community. He is the author of the RESTLog API, the Comment API, the draft RFC for the AtomAPI and the creator of the open source news aggregator Aggie, and publishes the site WellFormedWeb.org.

_

Click to return_

Speaker: Ceki Gulcu

Bio: Ceki Gülcü has over twelve years of development experience, including eight in the Java language. He holds a MS degree in Computer Science from Ecole Politechnic Federale of Lausanne. He is the founder of the log4j project and the author of The complete log4j manual. His interests include cryptography, anonymity, fair-exchange protocols and reliable systems at large.

Speaker: Hartmut Holzgraefe

Bio: Hartmut Holzgraefe PHP Developer, Author ... Hartmut started 'real' coding the hard way back in 1988 by writing his first production use UNIX device driver after playing around with home computers and BASIC for some years. He now holds university diplomas in both electric engineering and computer science / bioinformatics. His two theses were about handwritten character recognition and distributed robot control using neural network components. Hartmut started using (and patching) PHP C source and documentation in late 1999 while writing a customizable webmail client for Bertelsmann Telemedia. For the last three years he has been working for Six offene Systeme GmbH in Germany, developing content management and customer relationship solutions. He also did a lot of PHP bugfixing, extending and documentation during this time, so improving the platform his applications where built upon. Lately he has been working on PHP WebDAV, PECL_Gen for the creation of PHP extension code out of XML based description files and on the next issue of the first german PHP book.

Speaker: Sterling Hughes

Bio: Sterling Hughes is a freelance programmer, working developing applications on the Unix platform in C, C++, Perl, Java and PHP. He is the author of "The PHP Developer's Cookbook", and a developer on the PHP project, who's contributions include authoring the cURL, sockets and XSLT extensions. His email address is sterling@php.net.

Speaker: Will Iverson

Bio: Will Iverson served as Developer Relations Manager for the VisualCafé group at Symantec, as the Java & Runtimes Product Manager at Apple Computer and has led Cascade Technology Group, a private consulting firm, since 1999. He has spoken at a variety of technical conferences including JavaOne, MacWorld, ComDex, and more on behalf of a variety of companies including Symantec, Apple Computer, Sun Microsystems, and Canal+ Technologies. He is the author of the recently published O'Reilly book, 'Mac OS X for Java Geeks.'

_

Click to return_

Speaker: Nick Kew

Bio: The author has been a professional systems and software developer since graduating from Cambridge 20 years ago. He has been an enthusiast for the 'net since the 1980s, when he first saw the potential for distance-working and distance-learning to improve our lives. He has made it his main business since it started to gain popular acceptance in the mid '90s. His primary area of interest today is in Quality and Accessibility of Web technologies. The Web is by design an open and inclusive system, and we should aim to ensure that the reality lives up to the ideals! He currently serves on the W3C Evaluation and Repair Working group and Validator team. His flagship "Site Valet" product family has been described as setting the standard to aspire to by the principal developer of the W3C validator.

Speaker: Rasmus Lerdorf

Bio: Rasmus Lerdorf has been designing large-scale UNIX-based solutions since 1989. In the Open Source community, he is known mostly as the creator of the PHP scripting language. He has also contributed to a number of other Apache-related projects and is a member of the Apache-core team. He currently lives in the San Francisco area with his wife Christine.

Speaker: Ted Leung

Bio: Ted Leung is currently the principal of Sauria Associates, LLC. He is the author of the forthcoming "Professional XML Development with Apache Tools" to be published by Wrox in December 2003. He was the technical lead for the IBM XML4J parser which served as the initial code base for the Java version of xml.apache.org's Xerces parser. In addition to XML, Ted has worked on handheld computing, compound document architectures, and object-oriented databases.

Speaker: Howard Lewis Ship

Bio: Howard Lewis Ship is the creator of, and lead developer for, the Tapestry project. He has worked on a number of database-driven client/server applications using a variety of technologies and programming languages, and has been actively developing web applications using Java since 1997. He has published two articles about Java web application development in the Java Report. Mr. Lewis Ship is a member of the Apache Jakarta Project Management Committee and has recently been nominated to become a member of the Apache Software Foundation. He started programming in BASIC and 6502 assembly language at age 13 and never looked back. He is currently completing "Tapestry in Action" for Manning Publications.

_

Click to return_

Speaker: Elena Litani
Bio: Elena Litani is a software developer working for IBM. For the last couple of years, she has been a member of the W3C Document Object Model (DOM) Working Group, working on the DOM Level 3 specification. Since 2000 Elena has been an active contributor to the Apache Xerces2 project, working on the XML Schema and DOM Level 3 implementations in Xerces.

Speaker: Daniel Lopez Ridruejo
Bio: Daniel Lopez is an independent consultant focusing on server side open source solutions. He is the author of the mod_mono Apache module, the Comanche configuration tool, a variety of Linux and Apache related howtos and of the book "Teach Yourself Apache 2" from SAMS publishing.

Speaker: Stefano Mazzocchi
Bio: Stefano Mazzocchi is a member of the Apache Software Foundation and has been actively contributing to many Apache efforts over the last 6 years.

Speaker: Craig McClanahan
Bio: Craig McClanhan is a Senior Staff Engineer at Sun Microsystems. His current responsibilities include being the Web Layer Architect for the J2EE Platform, as well as the co-Specification Lead for JavaServer Faces (JSR-127). Craig is also a member of the Apache Software Foundation, and a member of the Jakarta PMC. He has been heavily involved in the development of Tomcat, and is the founding developer for Struts and several of the Jakarta Commons library packages.

Speaker: Kevin McGowan
Bio: Kevin has been a member of the University of Michigan's web team since 1997 and its technical lead and manager since 1999.

Speaker: Chris McManaman
Bio: Chris McManaman is a Business Integration Architect with RCG Information Technology. He is an Oracle Certified DBA and a Sun Certified Java Programmer. His primary expertise is identifying and providing data and application integration solutions to the energy industry.

_

Click to return_

Speaker: Glenn Nielsen
Bio: Glenn Nielsen is the Unix Programming Coordinator for the Missouri Research and Education Network, University of Missouri System. Glenn has 20 years programming experience which includes developing commercial software for the Amiga computer. Glenn has been a Tomcat developer for over three years. He authored the code which implements the Java SecurityManager in Tomcat 3.2 and Tomcat 4.0. Glenn has authored five JSP tag libraries for the Jakarta-taglibs project and is a member of the JSR52 JSP Standard Tag Library Expert Group.

Speaker: Steven Noels
Bio: Steven Noels is co-founder of Outerthought, a geek-level technical XML, Java and Open Source competence center focused on Apache Cocoon. Steven is a Cocoon and Forrest committer, and is known for his especialy lousy time management. Besides all that, he's chairing the Belgian XML User Group, and likes organizing events such as the Cocoon GetTogether. He maintains a weblog at http://blogs.cocoondev.org/stevenn/

Speaker: Andrew Oliver
Bio: Andrew C. Oliver is President of SuperLink Software, Inc., a consultant for the JBoss Group, LLC and a member of the Apache Software Foundation. He's an obscene interest in binary constructs and founded the Jakarta POI project.

Speaker: Joyce Park
Bio: Joyce Park is co-author of the Wiley book _PHP Bible_, and co-lead of the mod_pubsub project. Adam Rifkin is co-founder of KnowNow, Inc. and co-lead of the mod_pubsub project.

Speaker: Mark Pilgrim
Bio: Mark Pilgrim is the author of Dive Into Python, a free Python book for experienced programmers, and Dive Into Accessibility, a free book on web accessibility techniques. He works for MassLight, a Washington DC-based training and web development company, where, unsurprisingly, he does training and web development. But he lives outside Raleigh, North Carolina, because it's warmer.

_

Click to return_

Speaker: Chris Pirillo
Bio: Ask yourself: "How did Chris Pirillo parlay Lockergnome from a single Windows-centric newsletter into a series of daily tech-related mailing lists, best-selling books, digital how-to guides, a revenue-generating meme, radio show, annual conference, television gig, top ranking on Google for his first name, and a well-trafficked blog?" He didn't do it alone, and some of those secrets will be revealed at ApacheCon US 2003.

Speaker: Martin Poeschl
Bio: Martin Poeschl is senior developer at ANECON, developing web-applications in Java. He is member of the Jakarta PMC and involved in the development of Torque, OJB, Turbine and several other Apache projects.

Speaker: Ovidiu Predescu
Bio: Ovidiu is a software engineer with Google, where he spends his time working on solving interesting problems. He has been involved in open-source development since 1994, including the Objective-C support in GCC, the design and development of major components of the GNUstep system, XSLT processing and debugging support in Emacs, Cocoon and many others.

Speaker: Jason Purdy
Bio: Jason Purdy is the IT Manager for Journalistic, Inc., a publishing company in Durham, NC. Jason oversees all technical aspects and operations, but loves the time best when focused on developing Web applications, something he has been involved with since 1994. Jason has graduated from UNC-Chapel Hill with a Mathematical Sciences degree (Computer Science track), written several technical articles for various publications (including Dr. Dobbs, Java Developers Journal, Visual J++ Journal) and has given similar technical presentations at conferences around the world (including OOP, Comdex, Java SIG, XML One).

Speaker: Antoine Quint
Bio: Antoine Quint is an independent SVG consultant also participating to the W3C SVG Working Group as an invited expert. He also lives with his über-cat Stig Elmer, has a book in the works with his pal Robin Berjon, and published various articles on O'Reilly's XML.com and IBM's DeveloperWorks.

Speaker: Gianugo Rabellino
Bio: Gianugo Rabellino is the CTO of Pro-netics, a company member of the Orixo XML Business Alliance, a network of companies supporting Apache Cocoon. He has been involved in Open Source since 1993, founding the first italian Linux official support group. ASF committer since 2001, he is involved in the Apache Cocoon and Apache Xindice communities. He writes articles on XML and security technologies on european IT magazines, loves to hack at late night, sing opera and play violin.

Speaker: Garrel Renick
Bio: I have worked in the IT field for the last decade. Previous work includes application support, technical writing, and help system design. My current work focuses on application design for MOREnet--the Missouri Research and Educational Network and part of the University of Missouri system. I assist in the design and support of an e-mail, web site, and web applications hosting solution for state government, universities, colleges, K12 schools, libraries, and other affiliates that are connected to MOREnet's statewide network.

Speaker: Mark Roth
Bio: Mark Roth is a member of the Java(tm) 2 Platform, Enterprise Edition team. He has contributed to a number of key specifications and implementations and is currently a co-lead for the JavaServer Pages(tm) specification version 2.0.

Speaker: Theo Schlossnagle
Bio: Theo Schlossnagle is a Principal Consultant at OmniTI Computer Consulting where he designs and implements scalable solutions for highly trafficked sites and other clients in need of sound, scalable architectural engineering. During the last several years, he was a key participant at The Center for Networking and Distributed Systems at The Johns Hopkins University researching scalable distributed system design. Current research includes resource allocation techniques in dynamic models and distributed mail systems based on "eventual consistency". Theo is the author and maintainer of the mod_backhand load-balancing module for Apache, an author and maintainer of the Backhand Project.

_

Click to return_

Speaker: Henning Schmiedehausen

Bio: Henning Schmiedehausen, born in 1968, got his degree in computer science from the Friedrich-Alexander University in Erlangen in 1996. Since as long as he can remember he is "toying with computers", first with the Amiga, later with Unix and Unix-like operating systems. He is currently working as an independent software developer and consultant and describes his current work as doing "all things Internet". If he's not sitting in front of an X-Desktop, he enjoys Football (european style), role playing or tries to resurrect his lawn.

Speaker: Doc Searls

Bio: Doc is Senior Editor of Linux Journal and co-author of The Cluetrain Manifesto. He is a popular speaker, presenter, and writer and his Web log is avidly read on a daily basis by thousands of people.

Speaker: Chris Shiflett

Bio: Chris Shiflett has been developing Web applications with PHP for a number of years. He is the author of the HTTP Developer's Handbook and frequently writes about Web application security. As an open source advocate, he maintains several open source projects and is a member of the PHP development team.

Speaker: Trent Shue

Bio: Trent Shue is a Senior Project Manager for Bull Information Systems in Phoenix, Arizona. He has 23 years of industry experience in systems development, application development and databases. For the past 3 years Trent has managed the development of J2EE-related products, including managing a team of developers contributing to Objectweb in the areas of JOnAS, J2EE Connector Architecture and Transaction Management.

Speaker: Bruce Snyder

Bio: Bruce Snyder lives in the Denver, Colorado, metropolitan area. He is a lead developer on the Castor Project and a founding member and developer for the Apache Geronimo Project. Bruce has worked at various startups implementing J2EE and related solutions. Currently, Bruce is a senior software engineer at DigitalGlobe, a satellite imagery and information company located in Longmont, Colorado. Bruce has nearly eight years' experience as a software engineer. His experience with Java technology and J2EE runs the gamut from system design and architecture to implementation and testing.

Help

Speaker: Greg Stein
Bio: Greg Stein is a Director at CollabNet, Inc, where he manages their version control initiatives. In particular, CollabNet is developing a new, open source version control system called Subversion. He also spends a lot of time with WebDAV, Apache, and Python projects. Previously, Greg worked as a Development Manager at Microsoft on the Site Server product, and was a co-founder and Corporate Technologist at eShop, one of the first electronic commerce companies.

Speaker: Sander Striker
Bio: Sander Striker is an independent consultant and amember of the Apache Software Foundation. He is an active member of the Apache HTTP Server, Apache Portable Runtime and Subversion communities.

Speaker: Sander Temme
Bio: Sander Temme hails from Amsterdam, the Netherlands where he obtained a Masters degree in Experimental Physics. After completing his education he went on a round-the-world trip in an attempt to unlearn everything he just learned. He currently works for Covalent Technologies in San Francisco, where he does performance testing on Apache web servers. Sander is owned by Murphy, the wonder kitten.

Speaker: Doug Tidwell
Bio: Doug Tidwell is a Senior Programmer at IBM. He regularly speaks on XML, Java, and security topics at conferences and user group meetings. His job as a Cyber Evangelist is to help people evaluate and implement new technologies. He holds, with special gloves, a Masters Degree in Computer Science from Vanderbilt University and a Bachelors Degree in English from the University of Georgia.

Speaker: Mads Toftum
Bio: Mads Toftum is an independent consultant with more than eight years of experience in various ISP jobs. Previous projects include designing and developing HA www hosting in a shared unix/NT environment and more than two years building a commercial CA. In his spare time he is a committer on the httpd-docs project, developing payment software and actively helping users in #apache (freenode) and on the mod-ssl mailing list.

Speaker: Adam Trachtenberg
Bio: Adam Trachtenberg started using PHP in 1996 and is the coauthor of O'Reilly's PHP Cookbook. He has an M.B.A. from Columbia Business School, where he concentrated in general management and was the only student in his class not running Windows. Before returning to school, Adam co-founded and served as Vice President for Development at two companies, Student.Com and TVGrid.Com. At both firms, he led the front- and middle-end web site design and development.

Speaker: Michael Wechner
Bio: Michael Wechner is co-founder of Wyona and the original creator of Lenya, a CMS based on Cocoon. Before entering the world of open source software he studied mathematical physics at ETH and was doing three years of basic research on computer simulations of dendritic growth. He co-founded OSCOM and also spends a lot of time with other Open Source Content Management Systems.

Speaker: Casey West
Bio: Casey is a six year veteran specializing in Open Source based high-availability web development. He's spend most of his time hacking on Perl 5 and Perl 6 development, as well as random contributions to other OSS projects. At pair Networks he is a Systems Programmer working on services for nearly 150,000 hosted websites.

Speaker: Jim Winstead
Bio: Jim Winstead is the lead web developer for MySQL AB, one of the core PHP group members, and a member of the Apache Software Foundation.

Speaker: Mark Womack
Bio: Mark Womack has been developing software for over 12 years. He has been developing in Java for the past 4 years, focusing on web application development. He has been an active committer for the Apache Jakarta log4j project since April 2002, contributing features for the upcoming v1.3 release.

Speaker: Cliff Woolley
Bio: Cliff Woolley is a graduate student in computer science at the University of Virginia and a member of the Apache Software Foundation. He has been an active member of the Apache HTTP Server and Apache Portable Runtime Projects working on Apache 2.0 for the past three years and has administered Apache-based web servers since 1997.

Speaker: Geoffrey Young
Bio: Geoffrey Young is a frequent contributor to the mod_perl community and lead author of the mod_perl Developer's Cookbook. When not programming, he is busy spending time with his wife, daughter, and son slowly rebuilding their house a room at a time.

Speaker: Carsten Ziegeler
Bio: Carsten Ziegeler is the release manager of Apache Cocoon. He has been a committer on the project since 2000 and played a major role in designing and developing the current architecture. Carsten is the chief architect of the Open Source Group at S&N AG, Paderborn, Germany. He participates in several Open Source projects and various Apache communities. In July 2003 Carsten has been elected as an Apache Member.

Session:

M002: Tomcat Performance Tuning and Troubleshooting

Speaker:

Glenn Nielsen

Description:

This session describes how to collect and analyze data to troubleshoot problems and improve performance, with the goal of maximizing the performance and availability of your production instances of Apache Tomcat through configuration tuning. Some of the session's topics are:

* Performance tuning JVM memory usage and garbage collection
* Collecting and analyzing log data
* Configuring dB Connection Pools
* Configuring Tomcat for performance
* Application design for performance
* Using Apache to serve static content
* Load Balancing
* Common problems

Session:
MO03: XML in PHP 5
Speaker:
Adam Trachtenberg
Description:
PHP's XML support has always been disjointed; however, in PHP 5 this all changes. PHP 5 has completely rewritten and unified XML support using libxml. Learn about the new (and fully specification compliant) integrated DOM and XSLT extensions. Discover SimpleXML, an extension that makes reading XML natural and easy. Additional features, including XPath, will also be covered.

Session:

MO04: Beginning Tapestry: Java Web Components

Speaker:

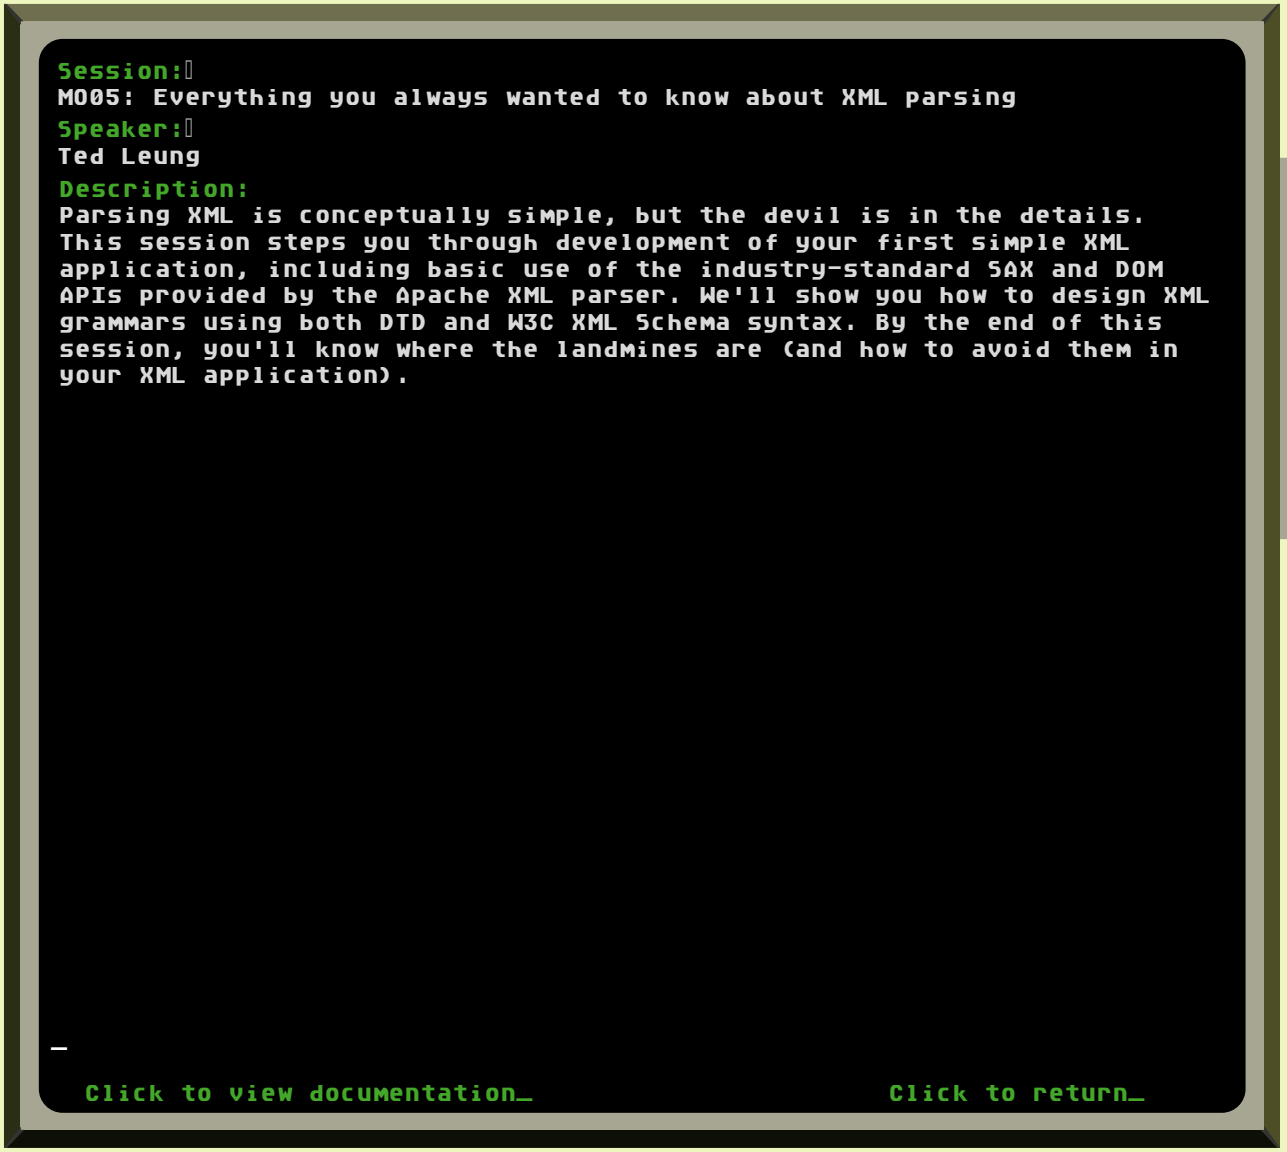

Howard Lewis Ship

Description:

An introduction to using the Tapestry web application framework by the creator of the framework. An overview of the framework will focus on the advantages of a component-based approach vs. the more typical operation-centric approaches. A simple application will be developed, making use of the Spindle plugin for Eclipse.

Session:
MO05: Everything you always wanted to know about XML parsing
Speaker:
Ted Leung
Description:
Parsing XML is conceptually simple, but the devil is in the details. This session steps you through development of your first simple XML application, including basic use of the industry-standard SAX and DOM APIs provided by the Apache XML parser. We'll show you how to design XML grammars using both DTD and W3C XML Schema syntax. By the end of this session, you'll know where the landmines are (and how to avoid them in your XML application).

Session:
MO06: JavaServer Pages 2.0 Technology: The Community Delivers!

Speaker:
Mark Roth

Description:
Over four years ago, JavaServer Pages(TM) (JSP(TM)) technology was created as a powerful way to dynamically generate HTML on the server side. Java(TM) 2 Enterprise Edition (J2EE) 1.4 will include the next generation of JSP technology, JSP 2.0, which represents an easy-to-use, robust, and extensible technology for building Web applications. JSP 2.0 is well-suited for generating dynamic Web content in such formats as HTML, DHTML, XHTML, SVG and XML. The JSP 2.0 specification is backwards compatible with JSP 1.2 and introduces many new features, including a simple yet flexible integrated expression language, an encapsulation mechanism called tag files, a simplified tag extension API, and a substantially improved XML syntax. These features were directly inspired by feedback from the community, and they help lower the bar by opening this presentation-tier language to non-programmers. This presentation will explore the new JSP 2.0 features in detail, with lots of examples, Q&A, and even a live demo!

Nov 16-19
APACHECON US 2003

Session:
M007: The State of Apache Geronimo

Speaker:
Bruce Snyder

Description:
The announcement of the Apache Geronimo project generated an incredible response from the community. Within its first month, the mailing list has already seen over 3000 messages. This response has translated into a large amount of people from all over the world working on the project. The Apache Geronimo project is an effort to develop an open-source J2EE container using a BSD-derived license that is fully compliant with the J2EE specification as well as fully Sun certified. The project will achieve this by building upon the many Java projects at the Apache Software Foundation. In addition, the project is bringing together leading members of the Castor, JBoss, MX4J, and OpenEJB communities, and possibly others. The intent of this session is to discuss the current status of Apache Geronimo as well as the roadmap for the future. The format of this session will be a presentation about Apache Geronimo followed by a question and answer/discussion session.

Session:
MO08: Java Applications with Apache Batik

Speaker:
Thomas DeWeese

Description:
The Apache Batik SVG Toolkit includes a Java-based viewing component for Scalable Vector Graphics (SVG). This talk will discuss how Java applications can leverage the Batik Toolkit to utilize SVG for complex graphics presentation and user interaction.

The presentation will cover topics such as:

* presenting SVG from URLs or pre-parsed XML documents in the user interface.
* Using Batik to rasterize SVG for use as icons or buttons.
* How to ensure a document is treated as a static or dynamic document.
* Accessing and using the Update Manager to make modifications to the displayed document.

How to add event handlers through the DOM to track user events and/or DOM mutation events will be presented. Finally custom interactors, what they are, the reasons for using them, and how they may be added to the viewing component will be discussed.

Session:
MO09: Inside Apache XMLBeans

Speaker:
David Bau

Description:
XMLBeans provides XML types in Java. In other words, it is a W3C XML schema compiler and a Java library that turns the full XML Schema spec into an XML programming language for Java. Its novel approach of binding full-fidelity XML to compiled Java APIs makes XML manipulation in Java simultaneously easy, fast, robust, interoperable, and complete. This session is an in-depth examination of the XMLBeans project. It is currently in incubation in Apache, and available as a standalone compiler and library. We will compare the XMLBeans approach to other XML APIs, and also explain how XMLBeans works with core XML data type challenges such as wildcards, substitution, restriction, and complex content models. We will briefly overview of how to use XMLBeans as well as survey some of the XMLBeans internals.

Session:
MO10: Jasper, the JSP compiler in Tomcat 5

Speaker:
Kin-man Chung

Description:
This talk provides an overview of the architecture of Jasper, JSP-to-Servlet compiler in Tomcat 5, including the internal representation of a JSP page and the various compilation phases. This talk also covers some of Jasper's performance improvements, as well as implementation details of some of the features introduced in JSP 2.0, such as tag files, simple tag handlers, JSP fragments, and EL expressions.

Session:
MO11: Virtual Community Dynamics

Speaker:
Stefano Mazzocchi

Description:
In this session it will be presented the experience acquired in creating a software tool name Agora for automatic discovery of social patterns in virtual communities thru the harvesting and data emergence of the email archives of the foundation. It will be shown the principles, the software architecture and will be shown how to apply the same concepts in other domains and in order environments, such as an internal corporate environment or accademic institution to discover social trends without disturbing privacy issues (since Agora doesn't work with email content but only with email headers and metadata).

Session:
MO12: Shoehorning Apache Onto Your Box: System Sizing Tips

Speaker:
Sander Temme

Description:
So, your web server machine may not be the fastest, shiniest machine, but it can still take a few hits without going down. In this session, we will examine how to configure both Apache and your Linux or Solaris OS to get the maximum out of your machine. We will discuss memory footprint, kernel tunings and more, and give you some ideas on how to make your web server survive the Christmas shopping season.

Click to view documentation_ Click to return_

Session:
M013: Introducing Apache Cocoon

Speaker:
Steven Noels

Description:
Apache Cocoon is an XML-centric framework for building web sites and web applications, making sure many people can collaborate on the management, flow, style, logic and content of a web project without any conflicts between the different collaborators. Cocoon can integrate with your existing J2EE environment, and connects to a wide variety of external datasources. It embeds a portal engine, several form handling frameworks and is also the foundation of Lenya, an incubating CMS framework. This introductory talk will bring you up to speed with the Cocoon framework.

Power On/Off

Session:
MO15: Torque and OJB - the Apache persistence frameworks
Speaker:
Martin Poeschl
Description:
Torque and OJB are persistence frameworks. While Torque uses a generator to build an object model based on your database, OJB allows to define a mapping between the object model and the database model. The session will show how the 2 frameworks work, and how they work together (using the Torque generator for OJB).

Session:
MO17: Past, present and future of the Apache Cocoon project

Speaker:
Stefano Mazzocchi

Description:
The Apache Cocoon project is often presented as a big, complex and hyperfunctional piece of software. In this session, we'll follow a totally different view and present Cocoon from an historical perspective, from its beginning to present day, and outline the possible evolutionary future. Even if Cocoon is heavily based on several XML technologies, the presentation will keep a high level overview where no XML knowledge will be required.

Click to view documentation_ Click to return_

Session:

MO18: Using Tomcat to build Desktop Applications

Speaker:

Will Iverson

Description:

Many desktop applications today are arriving with web browser interfaces instead of traditional GUI interfaces. The user installs the software on their system, but instead of launching a traditional interface, they interact with the application using their web browser. There are numerous advantages, such as an easier to support cross-platform interface, a familiar metaphor, and the potential for a user to access the application from another system on the network. In this seminar, we'll explore some of the issues and challenges around this paradigm. We'll look at some examples of applications that use this model, and we'll talk specifically about how Apache Jakarta Tomcat and other Apache projects are extremely well suited for this type of application. We'll examine how a Java-based web application was converted to a desktop application for use on both Mac OS X and Windows systems. Particular emphasis will be paid toward understanding how to build complete solutions that are easy for an end-user to install.

Session:
M019: Apache XML Parser: Xerces2 and Xerces C++

Speaker:
Elena Litani

Description:
This session gives a quick overview of the Apache XML Parsers for Java and C++, known as Xerces2-J and Xerces C++ respectively. The session describes the latest developments in Xerces2-J's support of open standards such as DOM Level 3, XML 1.1, JAXP and the post schema validation infoset. It also reviews the Xerces2 XNI framework, which the community recently finalized. The session wraps up with a discussion of on-going improvements to Xerces-C's completeness, robustness and usability in highly customized environments.

Session:
MO20: Extending HTTP Authentication

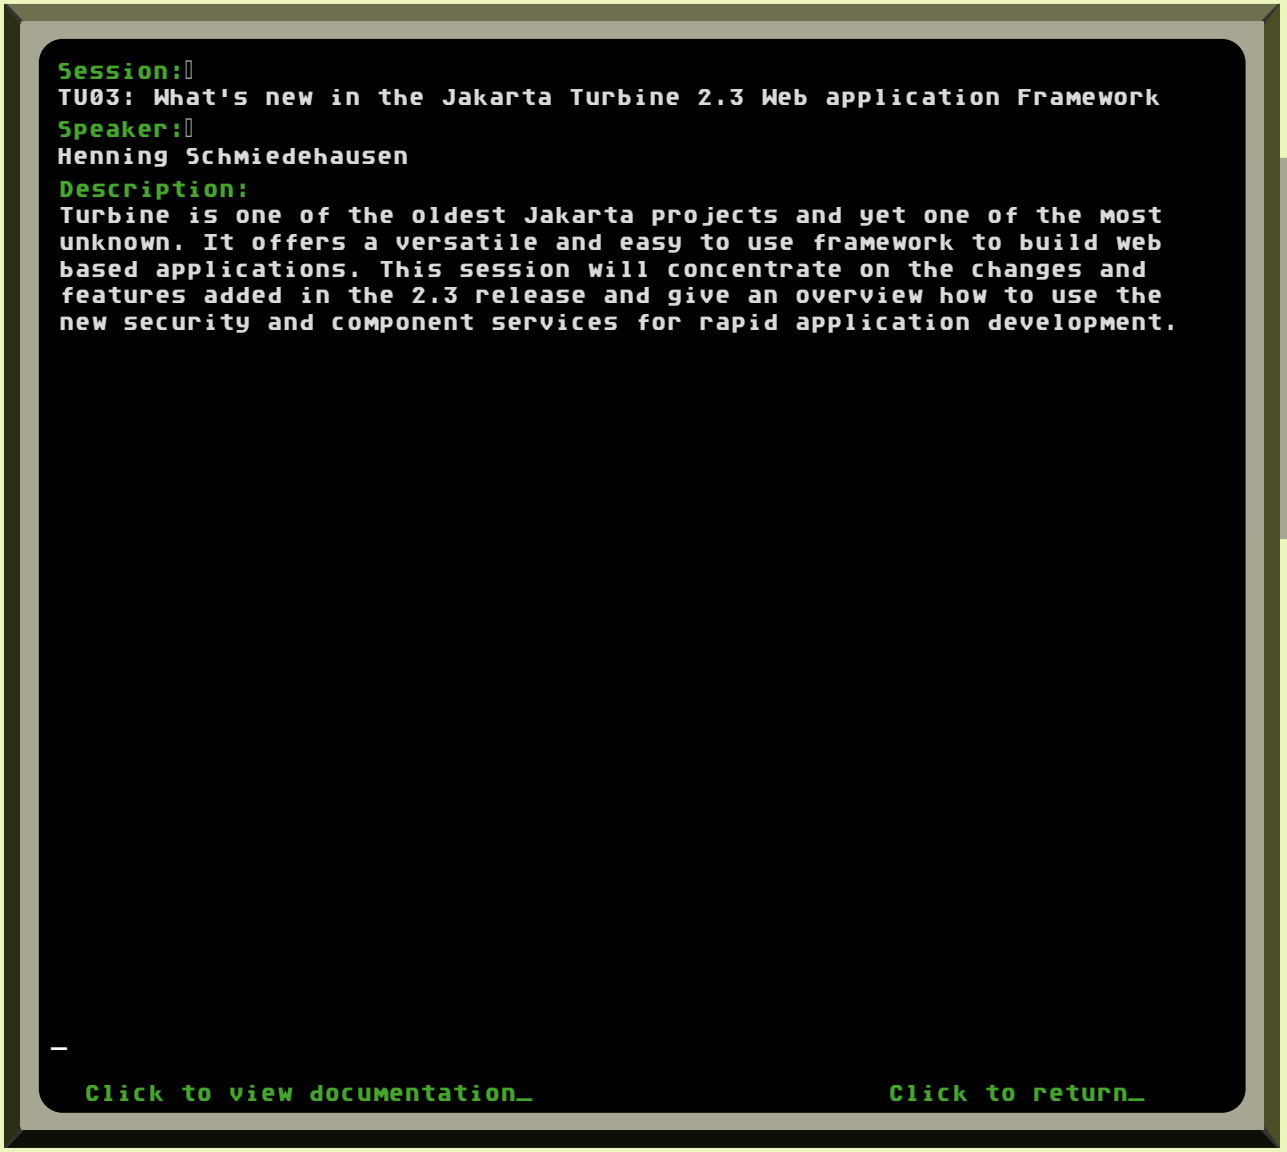

Speaker:
Joe Gregorio

Description:
In the course of designing the AtomAPI it became apparent there was a need for an additional security mechanism to be used along with Basic and Digest authentication. This talk will cover the requirements that led to our creating a new HTTP autentication scheme, the mechanics of the Atom authentication scheme, the lessons we learned from initially doing it wrong, and how the Apache web server's proper handling of unknown authentication schemes makes it all possible.

Click to view documentation_ Click to return_

Session:
TU01: Apache authentication
Speaker:
Rich Bowen
Description:
Authentication and Authorization are the process of finding out who is visiting your Web site, and determining whether they should be permitted to see content. Apache ships with two authentication methods, and there are dozens of others available from the module repository. This talk covers Basic and Digest authentication, several alternate authentication methods, and will delve into what's involved in writing your own access control module using mod_perl.
Click to view documentation_

Session:
TU02: Advanced Topics in Module Design: Threadsafety and Portability
Speaker:
Aaron Bannert
Description:
With the release of Apache 2.0 it is now possible to write modules that work under both Windows and Unix, in both multithreaded and multiprocess configurations. To achieve source portability while maintaining threadsafety and efficiency, a number of primitives can be utilized. In this session we will discover how modules can use primitives, including threads, mutexes, condition variables, read-write locks, and shared memory and explore multithreaded/multiprocess MPM considerations and techniques for avoiding race conditions and deadlocks. We will examine a sample module that demonstrates resource allocation, initialization and synchronization in the context of the Apache 2 hooks.
Participants should have some basic experience with multithreaded programming.

Session:
TU07: What is new in log4j version 1.3?

Speaker:
Ceki Gulcu, Mark Womack

Description:
Log4j is a Java logging framework affiliated with the Apache Software foundation. By some estimations one million Java developers use log4j regularly, ranking it as one of the most popular Java projects of the ASF. Log4j version 1.3 (to be released) will bring many new useful enhancements. These include:

* significant improvements in speed and memory management
* spectacular improvements to Chainsaw
* a new logging dimension in the form of logging domains
* highly extensible XML configuration files
* plugins, receivers, and watchdogs...
* support for custom conversion words in PatternLayout
* interoperability with log4j-like logging frameworks in other languages
* strategy based rollovers

This session will begin by quickly introducing log4j and proceed to discuss each of the aforementioned improvements in some detail.

http://www.apache.org/

Nov 16-19 APACHECON US 2003

Session:
TU10: Apache and Zeroconf Networking

Speaker:
Sander Temme

Description:
This session will discuss the possibilities for interaction between Apache servers and the Zero Configuration networking standard being developed by the IETF. After a brief introduction to Zeroconf, a module will be discussed and demonstrated that registers Apache httpd 2.0 services with a Multicast DNS Responder. Additionally, we will examine how Tomcat can register its deployed web applications. To conclude, we will discuss some applications and situations where making webservers and applications servers Zeroconf-aware might be useful.

Session:
TU11: Using Xalan to achieve application interoperability.

Speaker:
Chris McManaman

Description:
Within the first week of planning an enterprise integration project, we realized that XSLT was going to be the great enabler. In order to send XML messages to a wide variety of applications, XSLT was used to format the XML messages before being processed by the target application. Xalan was adopted to test the XSL transforms by the Java and .net developers because of strong debugging capabilities. This is a lesson on how to maximize the use of Xalan and how we transformed XML newcomers to XML lovers through XSLT.

Session:
TU12: Cocoon control flow

Speaker:
Ovidiu Predescu

Description:
This is an introduction to Cocoon's control flow layer based on continuations, a concept from high level functional languages. The control flow layer allows complex interactions in Web-based applications to be described in an easy way, using a normal procedural language like JavaScript. With the control flow a developer doesn't have to model the application state and the user interactions as a finite state machine. The talk describes the architecture of the control flow, and how it can be used for developing complex Cocoon-based Web applications.

Session:

TU13: Apache Security Secrets Revealed

Speaker:

Mark Cox

Description:

Some of the the press say that the Apache Web server is more secure than IIS, others that it has had as many incidents as competitive Web servers, but are either of these statements true? In this session we take a look through the security vulnerabilities that have affected Apache to date, looking at which are relevant and categorising their severity and exploitability. We then take a look at some of the things an administrator can do to protect themselves against these vulnerabilities through configuration changes and other tools on their platform.

Click to view documentation_ Click to return_

Session:
TU14: Building smart markup-aware applications With Apache modules

Speaker:
Nick Kew

Description:
The Apache 2 Filter Chain provides an excellent foundation for smart markup-aware applications. The talk will discuss several modules developed by the author, including:

* Application tools such as HTML and XML validation
* High-performance XSLT filter
* Transformation of outgoing HTML (mod_accessibility and mod_proxy_html)

as well as supporting modules for the above. In introducing this work, I will describe in some detail how I have harnessed the Apache Filter chain, and I would expect the talk to be of interest to module developers, particularly those on the learning curve to working with filters.

I will discuss markup processing in Apache, including how to work efficiently with XML and SGML libraries, and how smart, modular markup processing is used to empower users. I will also demonstrate profiling the performance of a filter module.

Session:
TU15: Building a Web service from SOAP to Nuts

Speaker:
Doug Tidwell

Description:
In this session, we'll look at all the issues involved in creating a Web service. We'll start with a simple piece of Java code, then we'll use the Axis toolkit to deploy it as a SOAP service. Next, we'll look at client applications written with Axis, Soap:Lite, .Net, PHP, SOAP.py, and other languages, illustrating how to access a SOAP service from a variety of languages and platforms. We'll take a look at some of the advanced features of the Axis toolkit, including serialization and messages with attachments. We'll look at using the relatively new security standards for Web services as well. The final topic we'll consider is service discovery. The service discovery portion will cover using WSDL files with UDDI registries to discover and invoke a Web service. We'll look at the Web Services Invocation Framework also. You'll leave with a complete understanding of the technologies in the Web services landscape, and see how software from the ASF plays a key role.

Session:
TU16: Porting CMS applications to WebDAV and Cocoon

Speaker:
Gianugo Rabellino

Description:
This session will show how a commercial, mainstream CMS has been replaced by a portable, pluggable and Open Source based XML Content Management System. Advanced use of WebDAV techniques and Cocoon will help the audience understand the value of both WebDAV native interoperability and XML based publishing, built on top of Apache Cocoon. Extensive reverse proxies technologies (using the newest ESI specs) will address the most massive scalability requirements. Apache projects shown and told: mod_dav (+Catacomb), Cocoon.

Click to view documentation_ Click to return_

Session:
TU17: WebDAV and Apache

Speaker:
Greg Stein

Description:
WebDAV is an exciting new technology for the World Wide Web. WebDAV stands for Web-Based Distributed Authoring and Versioning, and provides a way to remotely author and manage your Web servers (whether you are an author or an administrator). The WebDAV protocol is specified by RFC 2518 and RFC 3253 and is now built into the Apache Web server. This talk will present an overview of WebDAV, its benefits for users, and scenarios for effective deployment. The session will then detail how to set up the mod_dav Apache module, and the available tools and applications to use with your new WebDAV-enabled server. In closing, the talk will detail the future directions of the WebDAV protocol and how they will impact the Apache Web server.

Click to view documentation_ Click to return_

Session:
TU18: Scalable Apache for Beginners

Speaker:
Aaron Bannert

Description:
As computers become cheaper, websites are being deployed on increasingly powerful systems. Taking advantage of these high-powered systems is crucial to the success of any deployment. Since Apache is one of the most versatile web servers available, the default configuration rarely works well for a production environment right out of the box. However, minor configuration changes often result in huge performance benefits. In this session we will jump right into Apache configuration and identify performance-related directives. We will also look at how operating systems affect performance, discuss ways to monitor the health of your system and troubleshoot common problems, and look at some tools for measuring your site's performance. Benefits and tradeoffs of both Apache 1.3 and 2.0 (including the multithreaded "worker" MPM) will be presented, as well as some next-generation improvements that lie ahead. This session is applicable to the novice and intermediate website administrator.

Session:
TU19: The Cocoon Portal: More than the Portlet API (JSR 168)
Speaker:
Carsten Ziegeler
Description:
Portals and personalized web sites draw more and more attraction. The new standarized Portlet API (JSR 168) reflects the current development streams. The portal framework developed inside the Apache Cocoon project complies to this standard, but at the same time offers more functionality and support for developing your own portal applications. Apache Cocoon is the ideal solution for integrating different data sources while at the same time providing the information to different devices in different formats. You will learn the basics of Cocoon and will see how to build portal applications using the open source project.

Power On/Off

Session:
TU21: URL Mapping

Speaker:
Rich Bowen

Description:
When a request is made to your Apache Web server, Apache goes through several steps to figure out what content it is going to give you in response. This talk focuses on three aspects of this process:

* Directory indexing , which is the process of Apache delivering a default document from a directory, or a listing of the files in that directory;

* Content negotiation , which is a grossly underused feature that allows you to serve different content to different users, depending on their preferences; and

* URL rewriting , implemented by mod_rewrite, which is the process of modifying a URL as it comes in. Other aspects of URL mapping include Alias, ScriptAlias, Location, ErrorDocuments, and Redirect directives, which will be covered in passing on our way to the other topics.

Session:

TU23: Building Web Applications with the Struts Framework

Speaker:

Craig McClanahan

Description:

Apache Struts, an open-source framework for building Web applications and Web services, provides a basis for building maintainable, scalable applications based on Model-View-Controller design principles. This session will describe the essential features of the MVC architecture, and illustrate their use in Struts. We will also briefly review roadmaps and ideas for future development, including support for emerging standard APIs such as Portlets (JSR-168) and JavaServer Faces (JSR-127).

Click to view documentation_ Click to return_

Session:
TU24: WebDAV server implementation with Apache and PHP

Speaker:
Hartmut Holzgraefe

Description:
PHPs PEAR package HTTP_WebDAV_Server provides a convenient framework for the implementation of a WebDAV interface to your data by implementing most of the protocols internal aspects in an easily extesible PHP base class so that you can concentrate on the content, property and permission management for your data right from the start. By extending the PHP base class it is possible to create a customized WebDAV service within hours. The base class is implemented in 100% native PHP so that it is possible to implement and test a WebDAV service without the need to recompile modules or to restart Apache.

The base class already implements the HTTP protocol handling, parsing and generation of WebDAV specific XML request bodies and an easy to use authentication mechanism. All that needs to be done to create a full featured RFC 2518 compliant WebDAV interface to your data is to implement the actual methods that deal with data and property access, permission handling and locking of your data.

Data, property and lock handling are implemented using seperate interfaces so that it is even possible to combine customized data access methods with allready existing property storage and lock handling modules.

The PHP class has been tested against various WebDAV clients and even knows how to work around some of their 'issues'. A file system access sample implementation is included with the package and is able to pass all WebDAV compliance tests performed by the litmus test suite.

The session will give a tour to the package source code, the base class interface and will show how to implement a custom service by taking the file system implementation as an example. It will also show how to test a server for functionality (using popular WebDAV clients and the HTTP_WebDAV_Client PEAR package) and RFC 2518 compliance using the litmus test suite.

Session:
WE01: Creating Dynamic PDFs using PHP

Speaker:
John Coggeshall

Description:
Contrary to popular belief, PHP is much more than an HTML embedded scripting language. Although creating dynamic HTML files is generally the primary use of PHP, it can also be used to dynamically generate other document formats such as PDF files. In this session you can expect to learn how to create both PDF documents from scratch or from a pre-made template.

Session:
WE02: Writing Tests with Apache-Test

Speaker:
Geoffrey Young

Description:
Tests make your life easier, and Apache-Test makes writing live webserver tests easy. The Apache-Test framework is arguably one of the best things to emerge from the mod_perl 2.0 redesign effort. All you need to do is write the tests and *poof* -- Apache-Test takes care of configuring and starting the server, running your tests, stopping the server, and reporting back your successes (or failures). This talk will introduce the Apache-Test interface and detail how to let it make your life easier. We will step thought the processes of writing a complete test suite for a simple Apache module, from generating the test harness to deciding which aspects of our module ought to be tested - everything you need to be able to start writing tests for your neglected web applications.

Session:
WE03: Troubleshooting Apache configurations

Speaker:
Mads Toftum

Description:
Tests make your life easier, and Apache-Test makes writing live webserver
Common configuration errors and how to track them down. A set of often
used techniques that will help you to get your server up and running as
soon as possible. Where should you start looking in case of an error, and
how do you get the information you need to determine what went wrong.

APACHECON US 2003
Nov 16-19

Power On/Off

Session:
WE04: Parallel Development and Hosting using Apache, Tomcat, and MySQL

Speaker:
Garrel Renick

Description:
This session examines parallel desktop/server environments for web site and application server hosting. Both environments are built from Apache, mod_jk, Tomcat, and MySQL, but are OS-independent. Configuration choices were guided by security concerns, developer usability, and the need for applications to function without modification in both environments. Topics include the following:

* Creating a virtual host file structure that isolates customer content
* Sharing the web site docBase and webapp appBase without exposing web application source files
* Providing restricted access to virtual host server logs
* Leveraging mod_jk to improve performance of Apache and Tomcat
* Securing the database with MySQL grant tables and permissions
* Using JNDI for efficient access to database and mail services
* Securing your application server with the Tomcat SecurityManager
* Using the Tomcat Manager to delegate web application support

Session:
WE05: Do you PHP?

Speaker:
Rasmus Lerdorf

Description:
PHP is many things to many people. Today, little is left of the first version written almost 10 years ago, yet somehow the original ideas and concepts are very much alive and being used to drive everything from the tiniest personal sites to the largest web companies in the world. This talk will discuss the various ways people use PHP to solve the web problem. It will also present a systematic approach to designing, securing, tuning, benchmarking, and profiling your PHP-based web applications.

Session:
WE06: Why mod_perl 2.0 Sucks, Why mod_perl 2.0 Rocks

Speaker:
Geoffrey Young

Description:
Have you tried working with mod_perl 2.0 yet? Ugh. With all those new classes and directives to learn, not to mention the list of incomplete features, you might as well stay with the trusty, stable mod_perl of old. And subroutine attributes? Eesh. Of course, the new 2.0 API does let you do fun stuff like write output filters. Oh, and there's the Apache-Test framework that's pretty cool. Not to mention a method called assbackwards(). This fun talk will introduce mod_perl 2.0 by poking fun at its shortcomings as well as showcasing its promise.

Session:
WE07: HTML manipulation and data mining with Tidy

Speaker:
John Coggeshall

Description:
This talk will focus on introducing the new tidy extension for PHP5 and how it can be used to make working with and generating properly-formed HTML in a fast and effective manner.

* Specifically this session will focus on:
* How to use tidy to diagnose existing HTML for errors
* Using tidy to clean and repair HTML documents
* An overview of the most useful tidy options
* Using the tidy OO interface to navigate the HTML doc tree
* Examples of how to navigate HTML effectively using tidy

With the introduction of the Tidy extension, users will no longer need to rely on messy regular expressions to mine data such as URLs, e-mail addresses, or entire tables from HTML documents. Furthermore, thanks to the diagnosing technologies provided by Tidy, HTML documents can be diagnosed and even corrected on the fly to ensure complete HTML or XHTML compliance before being sent to the end user. This talk assumes users are familiar with basic PHP object-oriented and procedural constructs.

Session:
WE08: ObjectWeb/JOnAS J2EE Application Server and Apache projects

Speaker:
Trent Shue

Description:
This session highlights the use of Apache components within the JOnAS J2EE Application Server including a brief introduction to JOnAS and the ObjectWeb Open Source Consortium. The presentation focuses on how Tomcat is packaged with JOnAS to provide a web container and servlet/JSP engine creating a true J2EE platform. We will review how the JOnAS-Tomcat integration has inspired changes to JOnAS in areas of configuration, management console and EAR deployment. Also included will be a discussions of:

* J2EE Context support for uniform naming
* Security realm enhancements for EJB context support
* The use of Apache/Tomcat/mod_jk for providing HTTP clustering
* How the Jakarta Commons Digester for XML parsing is being applied within JOnAS
* The ObjectWeb middleware component approach

Session:
WE09: PHP Attacks and Defense

Speaker:
Chris Shiflett

Description:
PHP is quickly becoming the world's most popular programming language for creating Web applications. As more and more applications are being built for the Web, application security is becoming a crucial topic. One of the best methods you can use to educate yourself about Web application security is to study the various types of attacks that you must defend against. Shiflett's session introduces two common types of attacks that current Web developers face, Cross-Site Scripting (XSS) and Cross-Site Request Forgeries (CSRF). Because XSS involves exploiting the trust granted to a particular Web site and CSRF involves exploiting the trust granted to a particular user, these attacks represent a wide range of application-based attacks. By using examples that illustrate exactly how these types of attacks are achieved, you are shown simple and effective techniques that you can use to help prevent similar vulnerabilities in your own PHP applications.

Session:
WE10: Apache handlers with mod_perl

Speaker:
Rich Bowen

Description:
Most of the online tutorials about mod_perl focus on its use as a CGI performance enhancer (Apache::Registry and Apache::PerlRun). Using this technique, good programmers are able to gain many-times improvement in speed, and extend the life of their CGI programs. Unfortunately, most of these tutorials stop here, and don't go on to talk about what mod_perl is really good at. The real power of mod_perl is in writing Apache handlers in Perl. Although this is a fairly simple concept, it is downplayed a little, primarily because people already understand CGI, and it is usually simpler to show people how to use the code that they already have, and just make it faster. However, writing Apache handlers using mod_perl is easier than writing CGI programs, and by directly calling methods out of the Apache API, gives much better performance. Additionally, taking the opportunity to rewrite your CGI programs as mod_perl handlers will force you to write better code, and give you a better-designed system into the bargain. This talk will cover the aspects of Perl OO programming and Apache configuration that will be necessary for the core of the talk. We'll then dive into writing mod_perl handlers, configuring them for use with your mod_perl server, and get some simple ones running. Then, once we have some simple handlers running, we'll move on to slightly more in-depth topics, such as persistent database connections, template-driven content, and rapid development by factoring out common tasks. All concepts will be reinforced by examples and actual code, which will be distributed to attendees. Attendees are recommended to bring with them a laptop with Apache/mod_perl installed in order that they might follow along with the talk.

Session:
WE11: Apache mod_rewrite, the Swiss Army Knife of URL manipulation
Speaker:
Mads Toftum
Description:
mod_rewrite is a module which has intimidated and confused many Apache users over the years. This session will show how simple mod_rewrite can be, by breaking it down into manageable bits and by giving examples of everyday use. The session will also discuss when to use mod_rewrite, and when other modules might as well be used.

Session:
WE12: Mod_pubsub: asynchronous publish and subscribe messaging with httpd

Speaker:
Joyce Park

Description:
Turn your Apache http server into a pub/sub server using mod_perl and/or Python. Get real-time data updates to the browser with no plugins or polling. Plus, exchange data over the Internet between applications written in Perl, Python, PHP, C, C++, .NET, Java, or Ruby. Mod_pubsub is especially valuable for monitoring tools, real-time data dashboards, and integration between social software apps such as email, IM, blogs, and wikis -- all crucial parts of the intertwingly future architecture of the web.

Session:
WE13: Making the most of PEAR and PECL

Speaker:
John Coggeshall

Description:
This session is focused on the promotion of PEAR and PECL by useful example. It will introduce some of the more useful PEAR and PECL modules and show them in action. Topics will include unit testing, interesting PECL modules, and a general use of the entire PEAR system.

Session:

WE14: Developing Web Applications with CGI::Application

Speaker:

Jason Purdy

Description:

This session will introduce you to a powerful and flexible methodology of developing Web applications in Perl, following the MVC model. Using this system, developers will enjoy code-reuse, design separation and less re-invention of the wheel. We will cover how to get into the CGI::Application mindset, its benefits (& tradeoffs), best practices and future aspects to dig even deeper upon its adoption.

Session:
WE15: R55 Elements and Versions

Speaker:
Chris Pirillo

Description:
What's the difference between R55 0.91 and 2.0? Are newer revisions backwards-compatible with older news aggregators? What tools exist to help you craft and parse R55 on the client or server side? Learn the answers to these questions and the meaning of life, as Chris Pirillo takes you on an amazing journey filled with facts and fun.

Session:
WE16: Localising BBC News for a Global Audience

Speaker:
Stephen Betts

Description:
BBC News is amongst the most well-respected and popular news providers in the world. Its website serves 14 million pages per day, with about half of the requests originating from outside the UK. In 2002 an international edition of the website was launched, with the same content, but with the presentation focussed on world events. The exacting editorial requirements led to many technical challenges in serving the two editions. Giving users a seamless experience regardless of their chosen edition requires a complex interaction within request and response phases, for every page served. This interaction is handled by an Apache module written in-house over several months; its primary purpose is to ensure that users get the content that they want, not necessarily the content they ask for. This talk describes the development of the module; its implementation in a highly editorially-led environment; its evolution from having very specific functionality when it was launched, to becoming more modular and generic; and planned future developments, including utilisation of the advanced functionality of Apache 2, integration with IP Geography systems and the possibility of releasing it under an Open Source license.

Session:
WE17: PHP 5 and databases

Speaker:
Marcus Borger

Description:

* What's new in PHP 5

* mysqli, The new PHP 5 extension to connect to mysql v4 databases. Explain what♦s new compared to the old interface apart from the obvious version changes.

* sqlite, The new integrated single file database. This one could simplify ISP life and hence would allow to give anybody a database who can use PHP.

* PEAR mdb 2/3, The PEAR abstraction to databases. (- maybe we'll have an initial version of pdo/PHP Data Objects by then)

* Analyzing differences between data storages when used by PHP A comparison of dba, mysql, oracle, postgres, sqlite

Session:
WE18: Advanced Apache Administration With Perl

Speaker:
Casey West

Description:
Configuring Apache using a file based configuration can be found to scale poorly. Using mod_perl you can harness the power of runtime configuration. Dynamic configuration with Perl is simple and wildly powerful. In this session I'll show you how to administrate thousands of differing web servers, or dozens of mirrors, with little pain or effort using a variety of data stores. Perl is your key to high-availability web serving laziness.

Click to view documentation_ Click to return_

Session:
WE19: Writing a PHP Extension

Speaker:
Jim Winstead

Description:
This session will go through the process of designing, writing, and distributing a PHP extension from start to finish. The extension will expose a PHP interface to a C library, with both an object-oriented and procedural interface.

Click to view documentation_ Click to return_

Session:
WE20: Subversion: Version Control Rethought

Speaker:
Greg Stein

Description:
Subversion is a brand new version control system, intended to replace CVS. It provides an easy, fast, and capable version control system for your every-day needs. No longer do you need to suffer with CVS' foibles -- switching from CVS to Subversion is quite easy to do. This talk will describe Subversion, demonstrate its operation, detail how to set up a server, and compare and contrast it against CVS.

Keynote Session:
KN02: The Death of Email Marketing

Speaker:
Chris Pirillo

Description:
I sit here, in my comfy chair, surfing on a wireless Internet connection, grooming my inbox and deleting 90% of what's sitting in there. Why? It's junk. It's useless. This used to be my playground, and it was once the avenue through which I could deliver my thoughts to hundreds of thousands of people from all over the world. I'm not the only one who has to put up with unsolicited advertisements for sending money to a country that doesn't exist on any world map. Worse yet, my wife is getting e-mails that promise to increase the size of a part of her body that she doesn't have. We've been looking for a solution that will enable us to get back on track with our audience. Well, it's already out there - and it's free for anybody to use. The key? The bridge? The solution? The Rosetta Stone of online data. RSS. Really Simple Syndication.

Click to view documentation_ Click to return_

Keynote Session:

KN03: Apache and Do-It-Yourself IT (DIY-IT)

Speaker:

Doc Searls

Description:

The standard vendor story is about how they develop "solutions" that can be solved in no other way than with the vendor's products. But what is the customer story? What about the solutions customers create and improve for themselves? Apache, for example. That's a story that's not being told very much, and Linux Journal Senior Editor (and Cluetrain Manifesto co-author) Doc Searls will describe what he's found out about the underside of this iceberg. He'll present his own findings about the "great disconnect" between vendor and customer stories, and will be listening eagerly around the conference to tales of customer stories that are not yet being told, but should be.

APACHECON US 2003

Power On/Off

Welcome to the ApacheCon 2002 Documentation disc help page!

This disc was designed to run on most any system that has Adobe Acrobat Reader 6.0 or greater installed on it. Details are included in the file README.TXT

If the search function does not work, you need to upgrade your version of Acrobat Reader.

To navigate use the buttons to the right, and follow any directions in green text at the top or bottom of this Window.

If you are having trouble using Acrobat Reader itself...
RTFM!

Thank you.
